Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

The peptides of the invention are used to prepare a medicament to elicit an immune response in an animal. They are used to treat cancer such as prostate cancer and tumour metastasis. They are also useful for prophylaxis, for preparing monoclonal or polyclonal antibodies, and in conventional techniques of immunology, molecular biology, cell biology and recombinant DNA technology. The present sequence is a DNA encoding PSA derived peptide, CLP314.
The present invention describes a method for detecting the occurrence of a nucleic acid synthesising reaction during the synthesis of a nucleic acid with an enzyme. The method comprises the use of an insoluble substance formed in the reaction as an indication. The method can be used for detecting the presence or absence of a nucleic acid synthesising reaction (especially a nucleic acid amplification reaction). The method is useful in gene analysis, diagnosis of cancer and other diseases, and
                                                                                                                                                                                                                                                                                                   Detecting the product of an enzyme-based nucleic acid synthesizing reaction, useful in gene analysis, diagnosis of cancer and other diseases, and in identifying bacteria, comprises the formation of an insoluble substance -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mori
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 7; Page 28; 41pp; English.

                                                                    reaction. The method uses an arbitrary primer to initiate the complementary chain synthesis reaction. The method is particularly useful in gene and disease diagnosis. It is a highly efficient and reaction specific method in which no temperature variation is required. The present sequence is used in an example illustrating the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in identifying bacteria. The present sequence oligonucleotide used in the exemplification of
                                                                                                                                   The invention relates to a method for synthesising a nucleic acid using a double-stranded nucleic acid as template and incubating under conditions allowing the establishment of a complementary chain synthesis
                                                                                                                                                                                                      Isothermal amplification of nucleic acids using double-stranded nucleic acid as template to establish complementary chain synthesis reaction from primer enabling base pairing in domain to be annealed, useful e.g. in gene diagnosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 178 BP; 33 A; 56 C; 50 G;

The sequence is used to exemplify the invention. The specification describes a method for purifying RNA. The method comprises contacting a test sample with polyvalent transition metal ions to form a precipitant and a supernatant, separating the precipitant from the supernatant, and collecting the supernatant to obtain a purified solution of total RNA. The RNA is used for nucleic acid amplification and disease detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Purification of RNA, used for nucleic acid amplification and disease detection - by precipitating other sample components with transition metal ions, separating and collecting the purified RNA

Detection of PSA mRNA in the bloodstream indicates that prostate cells are circulating in the blood and confirms diagnosis of cancer. Circulating prostate cells also indicate a risk of a secondary tumour or bone metastatic anchoring. Detection of the PSA mRNA after prostatectomy or radiotherapy indicates a risk that the prostate cancer has spread and that the surgery and radiotherapy was not effective. PCR primers AAT92971-73 were used for the monitoring and diagnosis of patients with prostate cancer. The method comprises the detection of PSA mRNA by reverse transcriptase polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monitoring or diagnosis of prostate cancer - by detecting prostate-specific antigen mRNA using specific primers
                                                                                                                                                                                                                                                                                                                                             AAA61482 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method of isothermal DNA amplification.

CA region is produced at the 3' end of a target sequence which contains sub-sequences designated F1, F2C and F1C, where F1C is the complement of F1. A loop is formed by annealing of F1 to its complementary sequence F1C, and a primer containing a sub-sequence F2 (complementary strand to the template. The complementary strand to the template is synthesised using a DNA polymerase, and the process is repeated using sub-sequences at the 3' end of the complementary strand designated R1, R2C and R1C, using a primer containing R2 at its 3' end. Cand methods for the detection of a nucleic acid sequence in a sample cusing a labeled probe containing a sequence complementary to the loop cregion of the target sequence. The method of the invention provides an efficient and highly specific method for isothermal amplification of a target nucleic acid sequence using a simple reagent mixture.

The resent invention describes a new method for synthesising nucleic acids comprising: (a) preparing a nucleic acid, with an F2c region, able to form a loop by annealing the F1 region of the 3' end to the F1c region on the same chain; (b) synthesis of a complementary chain using the 3' end of F1 as the starting point; (c) replacing the complementary to F2c) at its 3' end and using it as a starting point for complementary chain synthesis by a polymerase; and (d) replacing the chain synthesised in step c by annealing a polynucleotide containing a region complementary to a part of the chain and using its 3' end as the starting point. Also described are: (1) a kit for synthesising nucleic acids; and (2) a kit for detecting target base sequences. The present

                                    Human kallikrein 2 (hK2) is expressed at elevated levels relative to the prostate cancer antigen, prostate specific antigen (PSA) by breast cancer cells when stimulated by androgens. Detecting levels of hK2 may provide a simple diagnostic tool for detecting or determining breast cancer. Detecting hK2 is achieved by producing an hK2 DNA from hK2 RNA by reverse transcription. The hK2 DNA obtained is then amplified by PCR and detected using probes. Determination of breast cancer may also be determined by exposing the hK2 DNA by periode to an agent which binds to it and then detecting the binary complex formed. The amount of complex formed correlates directly to the presence of breast cancer in the human individual. The methods can be used in the diagnosis, treatment and/or monitoring of the progression or remission of breast cancer and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence represents a prostate specific antigen related nucleotide sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human kallikrein 2; hK2; breast cancer; diagnosis; detection; treatment; monitoring; prostate specific antigen; PSA; ds.

The invention relates to a method of inducing a cell-mediated immune cresponse against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumour cells or virally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynucleotide (II) encoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, colorectal cancer and pancreatic cancer, as well as lymphomas and leukaemias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lentiviruses (including human immunodeficiency virus (HIV)), herpesviruses and the flaviviruses and pestiviruses. The present sequence represents the coding sequence of human prostate specific antigen (PSA) variant which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                             The invention relates to a method of immunization against prostatic cancer (PC) by administering a nucleic acid (this sequence) that encodes prostate-specific antigen (PSA), or its immunologically active fragment, operably linked to regulatory sequences. The nucleic acid is taken up by cells and then expressed to generate an immune response against PSA. The method is used to protect against, or treat, PC, or more generally to induce a cellular immune response to PSA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ47134 standard; DNA; 990 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunization; prostate cancer; prostate-specific antigen; PSA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antigen (PSA) cDNA PCR fragment. New oligonuclectide primers (AAT91044-53) are designed to amplify the PSA gene but not the human glandular kallikrein gene, which has 75-85% homology to the PSA gene. The primers can be used for diagnosis of prostate cancer micrometastasis. A claimed diagnostic kit for detecting prostate cancer comprises a pair of primers, where one of the primers is selected from those given in AAT91044-53, and a means for visualising amplified DNA (ethidium bromide stain, 32 por biotin). The invention also includes a method of detecting cells which express prostate cancer specific sequences by detecting the presence of nucleic acids specific for prostate cancer or a signal specific for

The invention relates to a method of detecting prostate cancer micrometastasis in a patient having stage D1, D2, or D3 prostate cancer, comprising: (1) obtaining a sample nucleic acid from a patient tissue; (2) amplifying nucleic acids specific for prostate cancer or amplifying a signal generated by hybridisation of a probe specific to a prostate specific nucleic acid in the sample, comprising hybridisation to at least 1 prostate cancer specific perimer which is complementary to a prostate cancer specific gene which does not hybridise to the human glandular kallikrein gene; and (3) detecting the presence of the amplified nucleic acids or the amplified signal where the presence of the amplified nucleic acids or the amplified signal where the presence of the amplified nucleic
                                                                                                acids or signal indicates micrometastasis of prostate cancer. The meth is useful for detecting micrometastasis of prostate cancer. The method allows the detection of a low concentration of cells.

The present sequence is one of a large number of 5′ ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5′ ESTs were prepared from total human RNAs or polyAr RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3′ untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5′ ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5′ UTR is rarely included. 5′ ESTs are derived from mRNAs with intact 5′ ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5′ ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID 3738; 71pp + CD-ROM; English.

Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /db_xref="taxon:9606"
